SAFETY PRECAUTIONS

DANGER/POISON

SHIELD EYES.
EXPLOSIVE GASES
CAN CAUSE BLINDNESS
OR INJURY.
SPARKS
CAUSE BURNS.
FLUSH IMMEDIATELY
WITH WATER.
READ ALL
INSTRUCTIONS.
DO NOT TIP.
KEEP VENT
CAPS TIGHT & LEVEL.
KEEP OUT OF
REACH OF CHILDREN.
WARNING: RISK OF FIRE, EXPLOSION OR BURNS. DO NOT DISASSEMBLE OR INCINERATE.
NOT RECOMMENDED FOR INVERTED USE. FOLLOW PROPER CHARGING INSTRUCTIONS.

PROPOSITION 65 WARNING: battery posts, terminals and related accessories contain lead and lead compounds, chemicals known to the State of California to cause cancer and reproductive harm. Batteries also contain other chemicals known to the State of California to cause cancer. WASH HANDS AFTER HANDLING.

Warning: Follow all safety instructions when handling batteries! Always wear safety glasses and a face shield when working on or near batteries.

All batteries generate explosive hydrogen gas. Keep sparks, flames and cigarettes away from batteries at all times. Do not connect or disconnect “live” circuits. To avoid creating sparks, always turn charging and testing equipment off before attaching or removing clamps.

ALWAYS DISCONNECT GROUNDED CABLE FIRST AND CONNECT IT LAST TO PREVENT DANGEROUS SPARKS.

Perform all work in a well ventilated area. Never lean directly over a battery while boosting, testing or charging it. PROTECT YOUR EYES!

Batteries contain corrosive sulfuric acid that can destroy clothing and burn the skin. Neutralize acid spills with a paste made of baking soda and water or large quantities of water. BE CAREFUL!

IN-VEHICLE SERVICE AND TESTING

Follow safety precautions: WEAR PROPER EYE PROTECTION!

Prior to any testing, visually inspect the battery. Look for:
- Cracked or broken case or cover
- Loose cable connections
- Leaking case-to-cover seal
- Corrosion
- Damaged or leaking terminals

Neutralize any corrosion with a baking soda/water paste or battery cleaner spray. Scrape or brush off the residue and wash the area with clean water. Following your visual inspection, check the battery’s state of charge with a voltmeter.

You must boost charge a weak battery before load testing. (See charging chart under “Charging Tips” section.) If fully charged, perform a load test. PROTECT YOUR EYES!

LOAD TESTING

Follow safety precautions: WEAR PROPER EYE PROTECTION!

First perform an open circuit voltage test, then an adjustable load test. A load test is the best way to determine if the battery is delivering adequate electrical performance. Make sure your variable load tester is working properly. When testing AGM batteries, make sure the tester has an AGM setting.

1. You can’t load test a discharged battery. If the voltage is below 12.4, be sure to completely charge it before continuing. Refer to the charging chart under “Charging Tips” section for important information.
2. To avoid sparking and explosive gases, be sure load tester is OFF and battery is disconnected before hook-up. Use computer memory saver to retain the vehicle’s electronic memory while the battery is disconnected.
3. Connect the positive (+) tester clamp to the positive (+) battery terminal. Then connect the negative (−) tester clamp to the negative (−) battery terminal. Always protect your eyes.
4. Set the tester for one-half the battery’s 0°F cold crank rating and apply the load for 15 seconds. (If the CCA rating is unknown, use 1/2 of the minimum O.E. battery CCA requirement of the vehicle.)
5. Estimate the internal temperature of the battery to the nearest 10°F. Apply the load for 15 seconds. Note the voltage at 15 seconds with the load on and immediately shut the load off. A reading at least equal to the value from the chart below indicates a good battery.

6. If the battery did not meet the required voltage and if it was not charged in Step 1, completely recharge the battery and repeat the test. If it still fails to meet requirements, replace the battery.
**ALWAYS WEAR EYE PROTECTION WHEN WORKING AROUND BATTERIES!**

**CONDUCTANCE TESTING**

Follow safety precautions: **WEAR PROPER EYE PROTECTION!**

Conductance uses the battery’s response to a very small signal in an attempt to predict the effects of a much larger current. Conductance testing is ineffective on a discharged battery. If the battery is known to be discharged or if the tester tells the operator to charge before testing again, the battery must be completely recharged.

1. It may not be required to turn a conductance tester off or on. If off, you must turn on immediately when connected to a battery. Most will turn off automatically if ignored long enough. Some have no battery of their own and get all their power from the battery being tested.

2. Connect the positive (+) tester clamp to the positive (+) battery terminal. Then connect the negative (−) tester clamp to the negative (−) battery terminal. If the battery has more than one pair of terminals (e.g., top posts and side terminals) always perform the testing on the terminals that are used in the vehicle. Use the proper charging adapters for stud or side terminal batteries. **Never connect tester to a bolt or stud.**

3. Turn on if needed. Enter the requested information. Be sure to distinguish between a CCA rating and a CA or MCA rating. If no rating is available, use the minimum O.C. battery CCA requirement of the vehicle.

4. If the tester says to replace a battery that was tested in the vehicle, repeat the testing after removing the cables and cleaning the posts.

**CHARGING TIPS**

Follow safety precautions: **WEAR PROPER EYE PROTECTION!**

- To avoid a battery explosion, never attempt to charge a frozen battery. Allow it to warm up to room temperature before placing on charge.

- **Warning:** Gel and AGM (Absorbed Glass Mat) batteries require a voltage-limited charger. Charging a Gel or AGM battery on a typical shop charger that exceeds 15.4 volts – even one time – may greatly shorten its life.

- **Important:** Never overcharge batteries. Excessive charging will shorten battery life.

**see charging chart below.**

**AGM 12-VOLT BATTERY CHARGING CONSIDERATIONS:**

Ideal charging varies by application. Many common battery chargers are not fully compatible with AGM batteries, however; they will not ruin the battery if used a few times over the battery’s lifetime in a vehicle. Adversely, not all chargers are really AGM compatible and can do significant damage to an AGM battery. Large “wheeled chargers,” found in many shops, which exceed 15.4 volts must be avoided. In the rare occurrence that an AGM battery needs to be charged outside of the vehicle’s charging system, charging voltage should be 13.8 – 14.8 @ 77°F (25°C). Not to exceed 30 AMPS.

**IMPORTANT: NEVER OVERCHARGE BATTERIES! EXCESSIVE CHARGING WILL SHORTEN BATTERY LIFE.**

* Charging time depends upon battery age, temperature, capacity, and efficiency of charger.
ALWAYS WEAR EYE PROTECTION WHEN WORKING AROUND BATTERIES!

**ROTATE BATTERY STOCK**

Use oldest batteries first. Batteries require periodic stock rotation and routine charging. Always rotate stock using the FIFO (First In, First Out) method—NOT FISH (First In, Still Here).

Example: L2 – Battery shipped November 2012

*Always use oldest batteries first.*

REMEMBER… WET OR DRY, ALWAYS ROTATE YOUR STOCK!

**BATTERY STORAGE TIPS**

Batteries should be stored in a cool, dry area in an upright position. Never stack batteries directly on top of each other unless they’re in cartons. Do not stack more than 3 high (2 high if battery type is heavy commercial).

Test wet batteries every 4–6 months and recharge if necessary. Always test and charge if necessary before installation.

(See “Charging Tips” sections.)

**JUMP STARTING DIAGRAM**

**INSTRUCTIONS FOR SAFE USE OF BOOSTER CABLES**

PRIOR TO JUMP-STARTING VEHICLE, REFER TO THE VEHICLE OWNER’S MANUAL TO DETERMINE THE TYPE OF CONFIGURATION (TRADITIONAL UNDER-HOOD BATTERY OR REMOTE ACCESS TERMINALS) AND FOR ADDITIONAL SPECIFIC INFORMATION.

1. The black cable and clamps are negative (–) and the contrasting color cable and clamps are positive (+).
2. Make certain vehicles are not touching and both ignition switches are in the “OFF” position.
3. Connect the positive (+) clamp to the positive (+) battery or remote access terminal [as applicable] of the stranded vehicle. (Fig. A In Illustration)
4. Connect the other positive (+) clamp to the positive (+) battery or remote access terminal [as applicable] of the servicing vehicle. (Fig. B In Illustration)
5. Connect the negative (–) clamp to the negative (–) battery or remote access terminal [as applicable] of the servicing vehicle. (Fig. C In Illustration)
6. If the stranded vehicle is a traditional under-hood battery configuration, make the final connection of the other negative (–) clamp to the engine block or frame. (Fig. D In Illustration)
7. If the stranded vehicle is a remote access terminal configuration, make the final connection of the other negative (–) clamp to the negative (–) remote access terminal. (Fig. D In Illustration)
8. Start the servicing vehicle and allow it to run for at least 30 seconds. Then, start the stranded vehicle and remove the booster cable in REVERSE order of the above connections.
